

Claims

- [c1] Light source system with open flames, consisting of:
- A body (1), on which is at least one cylinder (2) and at least a second transparent cylinder (6) whose top ends are open and whose ends are connected by the body (1) to form a u-shaped container enabling an unrestricted air stream between the two upper leg (2,6) openings through the body (1).
 - Heat sources or fans which generate an upward-directed air stream in one leg (2), which results in an downward-directed air stream in the other leg (6) through the u-shaped container.
 - A light source with a visibly downward burning flame, whose burning direction is generated by the downward-directed air stream.
